# Solution 2: Give me your feature name and I'll call you

## ETH Zurich

## 1 Zurich needs more stations

Listing 1: More feature calls

```
explore
    −− Modify the map.
  do
    Zurich.add_station ("Zoo", 1600, 500)
    Zurich.connect_station (6, "Zoo")
    Zurich_map.update
    Zurich_map.fit_to_window

    wait (3)
    Zurich_map.station_view (Zurich.station ("Zoo")).highlight
    wait (1)
    Zurich_map.station_view (Zurich.station ("Zoo")).unhighlight
    wait (1)
    Zurich_map.station_view (Zurich.station ("Zoo")).highlight
    wait (1)
    Zurich_map.station_view (Zurich.station ("Zoo")).unhighlight
    wait (1)
    Zurich_map.station_view (Zurich.station ("Zoo")).highlight
    wait (1)
    Zurich_map.station_view (Zurich.station ("Zoo")).unhighlight
  end
```

## 2 Introducing yourself

Listing 2: Introduction

```
execute
        −− Run application.
    do
        Io.put_string ("Name: ")
        Io.put_string ("John Smith")
        Io.new_line
        Io.put_string ("Age: ")
        Io.put_integer (20)
        Io.new_line
        Io.put_string ("Mother tongue: ")
        Io.put_string ("English")
        Io.new_line
        Io.put_string ("Has a cat: ")
```

```
        Io.put_boolean (True)
    end
```

# 3 Command or Query?

1. *name* is a query.

2. *buildings* is a query.

3. *add_line* is a command.

4. *connecting_lines* is a query.

5. *move_all* is a command.

6. *north* is a query.

# 4 Objects and Classes

The order in which the questions and the answers appear here in the solution may vary because they are randomly shuffled at each attempt.

- One class is a template for defining a set of possible objects.

- Each object is an instance of its generating class.

- While classes exist only in the software text, objects exist during execution as well.

- In software text objects are visible and represented by names denoting run-time instances of classes.

- One class represents a category of things. One object represents one of these things.
